

QUALITY DIVERSITY

Quality diversity algorithms, rather than finding a specific good solution to a problem, construct archives of different high performing solutions. “Different” can be defined in various ways, an obvious example being “solutions that look different to a vision model” [1]. A popular¹ quality diversity algorithm is the pedagogically named Multi-dimensional Archive of Phenotypic Elites (MAP-Elites) [2]. Think of it as having a fitness dimension, on which we maximize, and (a) behavior dimension(s) which we want to populate.

1 | Content generation

We can optimize levels, just like we can optimize players. You must now:

- ▶ Define a fitness function for a level
- ▶ Define a behavior space for a level
